# 1 Bubble Sort

Given a list of numbers  $a$ .

We check each pair of adjacent numbers in the list  $(a_i, a_{i+1})$ .

If  $a_i > a_{i+1}$ , we swap  $a_i$  and  $a_{i+1}$ .

We repeat this process until we check every tuple without performing the swap operation.

	Best-case	Average-case	Worst-case
<b>comparison</b>	$O(n)$	$O(n^2)$	$O(n^2)$
<b>swap</b>	$O(1)$	$O(n^2)$	$O(n^2)$

---

**Algorithm 1** Bubble Sort

---

```
swapped  $\leftarrow$  false
do
  swapped  $\leftarrow$  false
  for  $i \leftarrow 0$  to  $\text{length}(a) - 1$  do
    if  $a_i > a_{i+1}$  then
      swapped  $\leftarrow$  true
      swap  $a_i$  and  $a_{i+1}$ 
while swapped
```

---

## 2 Selection Sort

Given a list of numbers  $a$ .

We find the minimum value in the list starting from an offset of 0.

We swap the minimum value and the value at the offset.

We increment the offset by 1 and repeat this process while the offset is less than the length of the list.

	Best-case	Average-case	Worst-case
comparison	$O(n^2)$	$O(n^2)$	$O(n^2)$
swap	$O(1)$	$O(n)$	$O(n)$

---

**Algorithm 2** Selection Sort

---

```
for  $i \leftarrow 0$  to  $\text{length}(a) - 1$  do
   $\text{min} \leftarrow i$ 
  for  $j \leftarrow i + 1$  to  $\text{length}(a)$  do
    if  $a_j < a_{\text{min}}$  then
       $\text{min} \leftarrow j$ 
  swap  $a_i$  and  $a_{\text{min}}$ 
```

---

### 3 Gnome Sort

Given a list of numbers  $a$ .

We start at the beginning of the list. Until we reach the end of the list, we check each tuple.

If the tuple is sorted, we increment our position by 1. If the tuple is not sorted, we swap the adjacent numbers and decrement our position by 1.

If we are moving left and our position is 0, we go right instead.

---

**Algorithm 3** Gnome Sort

---

```
 $i \leftarrow 0$ 
while  $i < \text{length}(a) - 1$  do
  if  $a_i > a_{i+1}$  then
    swap  $a_i$  and  $a_{i+1}$ 
    if  $i = 0$  then
       $i \leftarrow i + 1$ 
    else
       $i \leftarrow i - 1$ 
  else
     $i \leftarrow i + 1$ 
```

---
