# 1 Definition

A sequence denotes a series of indexed values. A sequence may be written as

$$\{a_n\} \quad \{a_n\}_{n=1}^{\infty}$$

If  $\lim_{n \rightarrow \infty} a_n$  exists and is finite we say that the sequence is *convergent*. If  $\lim_{n \rightarrow \infty} a_n$  doesn't exist or is infinite we say that the sequence *diverges*.

If  $f(x)$  is a function such that  $f(n) = a_n$

$$\lim_{x \rightarrow \infty} f(x) = L \implies \lim_{n \rightarrow \infty} a_n = L$$

## 1.1 Properties

if  $\{a_n\}$  and  $\{b_n\}$  are convergent sequences, then

$$\lim_{n \rightarrow \infty} (a_n \pm b_n) = \lim_{n \rightarrow \infty} a_n \pm \lim_{n \rightarrow \infty} b_n$$

$$\lim_{n \rightarrow \infty} ca_n = c \lim_{n \rightarrow \infty} a_n$$

$$\lim_{n \rightarrow \infty} (a_n b_n) = \left( \lim_{n \rightarrow \infty} a_n \right) \left( \lim_{n \rightarrow \infty} b_n \right)$$

## 2 Squeeze Theorem

If  $a_n \leq c_n \leq b_n$  for sufficiently large  $n > N$  for some  $N$  and  $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} b_n = L$  then  $\lim_{n \rightarrow \infty} c_n = L$

## 3 Absolute Value

Note the following

$$-|a_n| \leq a_n \leq |a_n|$$

Then if we assume

$$\lim_{n \rightarrow \infty} (-|a_n|) = - \lim_{n \rightarrow \infty} |a_n| = 0$$

by the Squeeze Theorem we get

$$\lim_{n \rightarrow \infty} a_n = 0$$

We conclude that if  $\lim_{n \rightarrow \infty} |a_n| = 0$  then  $\lim_{n \rightarrow \infty} a_n = 0$ .

## 4 Exponential sequence

The sequence  $\{a^n\}_{n=0}^{\infty}$  converges iff  $-1 < r \leq 1$

$$\lim_{n \rightarrow \infty} a^n = \begin{cases} 0 & \text{if } -1 < r < 1 \\ 1 & \text{if } r = 1 \end{cases}$$

## 5 Convergence of even and odd indexes

**Theorem.** If  $\lim_{n \rightarrow \infty} a_{2n} = L$  and  $\lim_{n \rightarrow \infty} a_{2n+1} = L$  then  $\{a_n\}$  is convergent and  $\lim_{n \rightarrow \infty} a_n = L$ .

*Proof.* Let  $\epsilon > 0$ .

Since  $\lim_{n \rightarrow \infty} a_{2n} = L$  there exists an  $N_1$  such that if  $n > N_1$  then

$$|a_{2n} - L| < \epsilon$$

Also, since  $\lim_{n \rightarrow \infty} a_{2n+1} = L$  there exists an  $N_2$  such that if  $n > N_2$  then

$$|a_{2n+1} - L| < \epsilon$$

Let  $N = \max(2N_1, 2N_2 + 1)$  and let  $n > N$ . Then either  $a_n = a_{2k}$  for some  $k > N_1$  or  $a_n = a_{2k+1}$  for some  $k > N_2$ . Either way we have

$$|a_n - L| < \epsilon$$

which satisfies the convergence of  $\{a_n\}$ . □

## 6 Terminology

### 6.1 Increasing

A sequence is *increasing* iff  $\forall n : a_n < a_{n+1}$ .

### 6.2 Decreasing

A sequence is *decreasing* iff  $\forall n : a_n > a_{n+1}$ .

### 6.3 Monotonic

If  $\{a_n\}$  is increasing or decreasing it is also called *monotonic*.

### 6.4 Bounded below

If there exists a number  $m$  such that  $\forall n : m \leq a_n$  the sequence is *bounded below* by a lower bound.

### 6.5 Bounded above

If there exists a number  $m$  such that  $\forall n : m \geq a_n$  the sequence is *bounded above* by an upper bound.

### 6.6 Bounded

If the sequence is both bounded above and bounded below it is said *bounded*.
