## 1 Law of sines

Given a triangle with sides  $a$ ,  $b$  and  $c$  and their respective opposite angles  $\alpha$ ,  $\beta$  and  $\gamma$

$$\frac{\sin(\alpha)}{a} = \frac{\sin(\beta)}{b} = \frac{\sin(\gamma)}{c}$$

## 2 Law of cosines

Given a triangle with sides  $a$ ,  $b$  and  $c$

$$c^2 = a^2 + b^2 - 2ab \cos \gamma$$

where  $\gamma$  is the angle between  $a$  and  $b$  (opposite of  $c$ ).

## 3 Pythagorean identities

An arbitrary angle  $\theta$  on the unit circle forms a triangle with sides 1,  $\sin \theta$  and  $\cos \theta$ .

Give the Pythagorean theorem we have

$$\sin^2 \theta + \cos^2 \theta = 1$$

which implies

$$\sin \theta = \pm \sqrt{1 - \cos^2 \theta}$$

$$\cos \theta = \pm \sqrt{1 - \sin^2 \theta}$$
